

# RightGreen Carbon Reduction Plan

RightGreen Recycle Ltd, based in Bradford, West Yorkshire, is committed to reducing the carbon emissions associated with our removals, relocations, storage and delivery operations. Our plan focuses on reducing vehicle emissions, improving the energy efficiency of our premises and working with customers and suppliers to deliver our services with less environmental impact.

We are committed to achieving Carbon Neutrality by 2030, using our 2025 emissions as the baseline and prioritising genuine emissions reductions across our operations and supply chain.

## 1. Reporting Year and Baseline Emissions

**Reporting year:** 2025   **Baseline year:** 2025

The 2025 reporting year is the baseline period used by RightGreen Recycle Ltd to measure and report progress against its carbon reduction objectives. Our 2025 carbon footprint is:

| Emissions Scope                 | 2025 Baseline    |
|---------------------------------|------------------|
| Scope 1 – Direct emissions      | 18.7 tCOe        |
| Scope 2 – Purchased energy      | 12.2 tCOe        |
| Scope 3 – Value-chain emissions | 53.8 tCOe        |
| <b>Total</b>                    | <b>84.7 tCOe</b> |

This baseline will be used to measure our progress towards carbon neutrality.

## 2. Carbon Reduction Actions

Our carbon reduction approach focuses on reducing emissions across our vehicles, premises and day-to-day removals and relocation activities. We will progressively move towards electric and lower-emission vehicles, while improving route planning, consolidating journeys and reducing unnecessary mileage and vehicle idling. Our removal teams will also plan each job carefully to maximise vehicle capacity and minimise repeat or return journeys.

At our main Bradford premises, we are investing in energy-efficient infrastructure, including the installation of LED lighting, solar photovoltaic panels and a ground source heat pump. These measures will reduce electricity and heating requirements while increasing our use of renewable energy. We will also install an EV charging unit at our main office to support the transition towards electric vehicles.

We will work with our suppliers and subcontractors to identify lower-carbon materials, services and transport options, helping to reduce our Scope 3 emissions. Progress will be monitored through annual tracking of fuel, electricity and vehicle usage, allowing us to measure our performance against our 2025 baseline of 84.7 tCOe and identify further opportunities for reduction.

## 3. Target

Our objective is to achieve Carbon Neutrality by 2030, reducing emissions as far as practically possible through operational improvements, renewable energy, fleet transition and supply-chain engagement.

We will review our emissions annually against the 2025 baseline of 84.7 tCOe, with progress used to identify further carbon reduction opportunities. Any unavoidable residual emissions will be addressed through appropriate carbon reduction or offsetting measures in line with recognised good practice.

#### 4. Governance, Approval and Public Availability

This Carbon Reduction Plan has been reviewed and approved at company director level. Senior management will oversee implementation and review progress against the stated baseline and target on an annual basis.
